what is worng with this part of my code if [A[i]<= | Shared Copilot Chat
why does this function works for i in range (1, N | Shared Copilot Chat
what is a function that could be used to get the n | Shared Copilot Chat

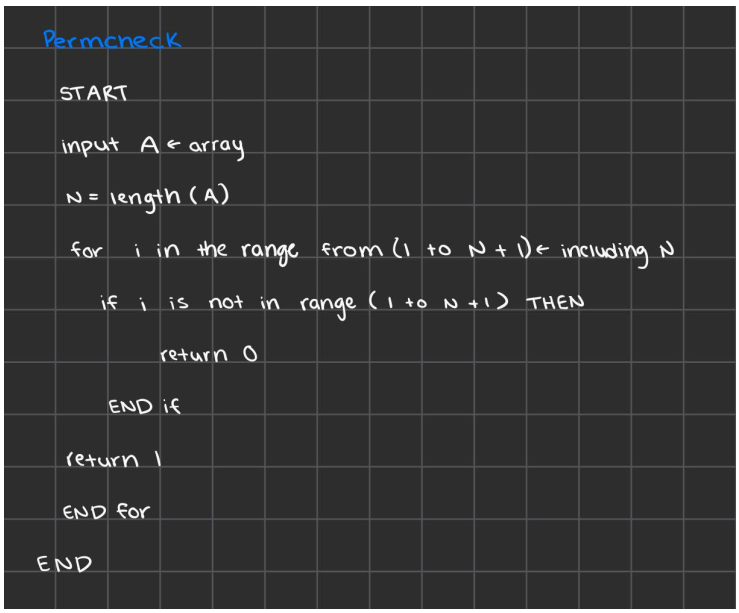

Pseudocode Writing

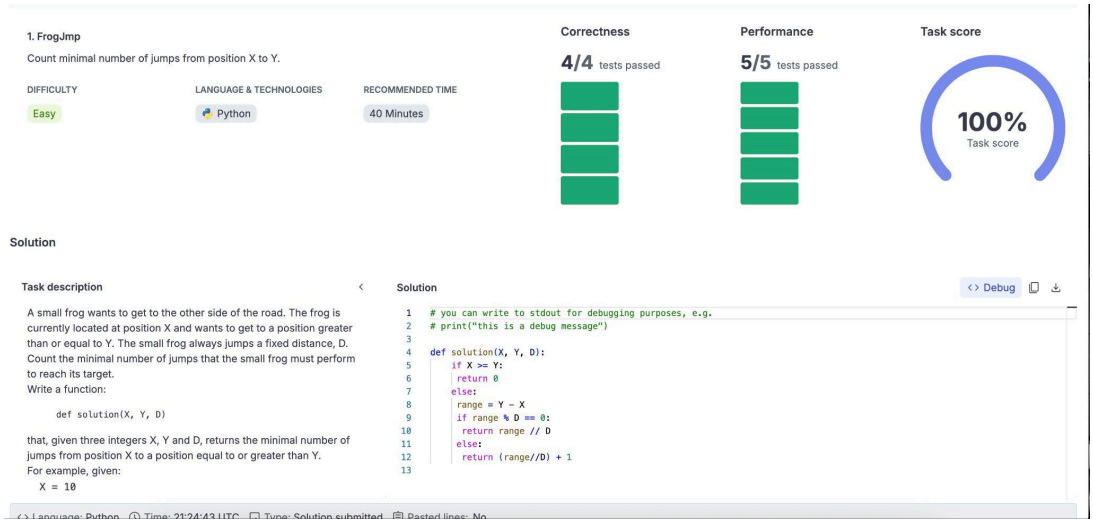

```
FrogRiver one
START
 Input X, A
 create array B with size X, filled with -1
 for i in range from 0 , length(A)
    if A[i] <= X and B[A[i]-1] == -1 : THEN
                B[A[i]-1] = i
      END if
      END for
 m = 0
 for i in range (0, len(A)):
    if B[i] == -1 : THEN
        return -1
    END if
     m = Max(m, B[i])
    END for
 return m
END
```

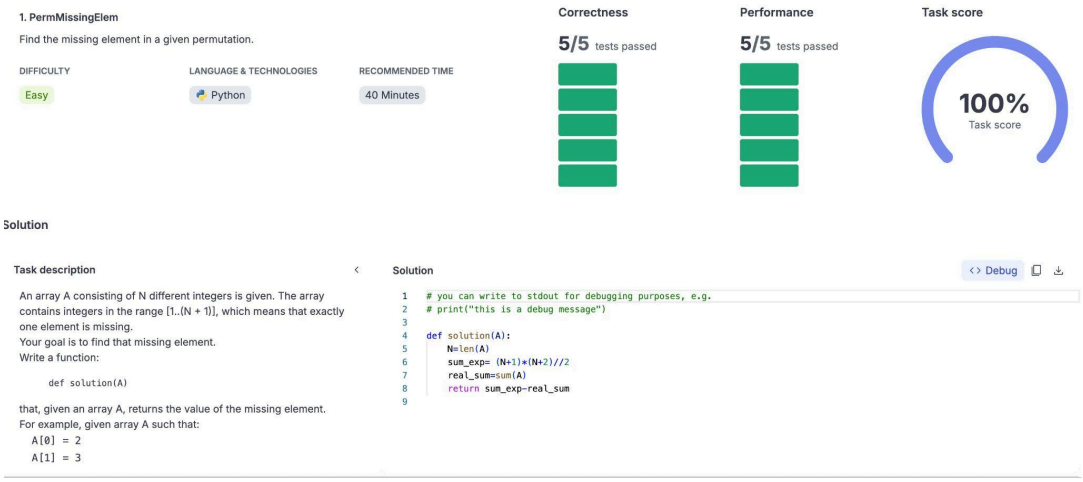

```
PermCheck
  START
  input A ← array
  N = length (A)
  for i in the range from (1 to N + 1) ← including N
     if i is not in range (1 to N +1) THEN
          return 0
     END if
  return 1
  END for
END
```

```
passing cars
 START
input A
East = 0
west = 0
for i in range from (0, length(A))
    if A[i] = = 0 :  THEN
        East += 1
    elif A[i] = = 1 : THEN
       west += East
    if W > 1000,000,000 :THEN
        return -1 if NOT
    END if
    END For
return W
```

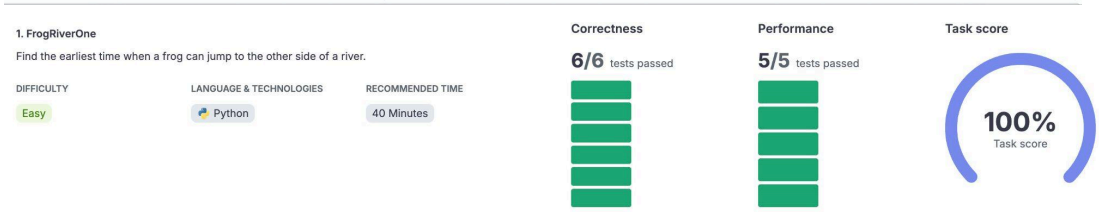

## Correctness test

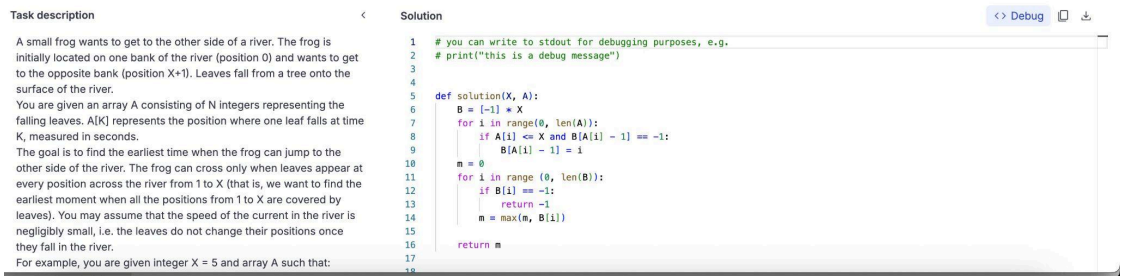

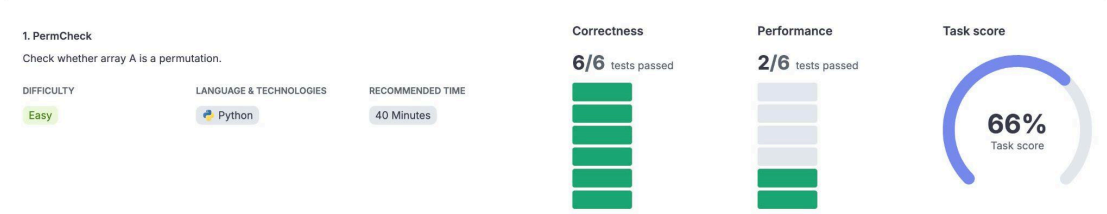

Solution

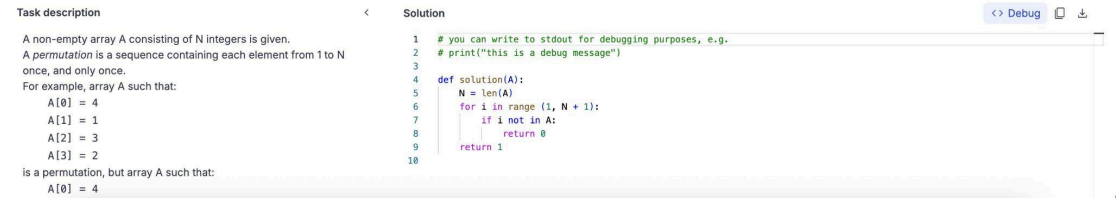

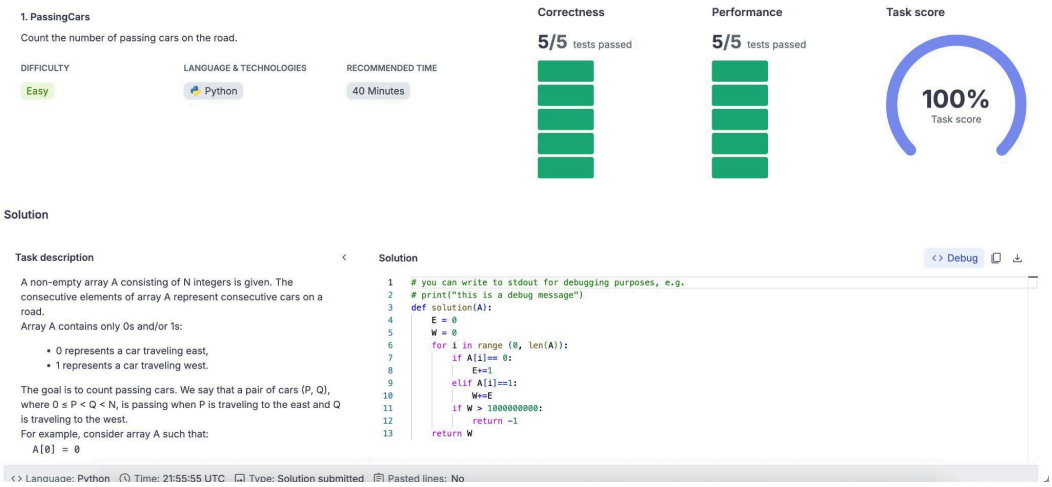

olution

Solution

1. PassingCars
Count the number of passing cars on the road.

Solution
Task description
A non-empty array A consisting of N integers is given. The consecutive elements of array A represent consecutive cars on a road.
Array A contains only 0s and/or 1s:
0 represents a car traveling east,
1 represents a car traveling west.
The goal is to count passing cars. We say that a pair of cars (P, Q), where 0 ≤ P < Q < N, is passing when P is traveling to the east and Q is traveling to the west.
For example, consider array A such that:
A[0] = 0
Solution
Debug
# you can write to stdout for debugging purposes, e.g.
# print("this is a debug message")
def solution(A):
E = 0
W = 0
for i in range (0, len(A)):
if A[i]== 0:
E+=1
elif A[i]==1:
W+=E
if W > 1000000000:
return -1
return W
